

01 Batch Ingestion & orchestration using AWS Airflow & Redshift

Use case: Batch Ingestion & orchestration using AWS Airflow & Redshift

Use case: Batch Ingestion & orchestration using AWS Airflow & Redshift

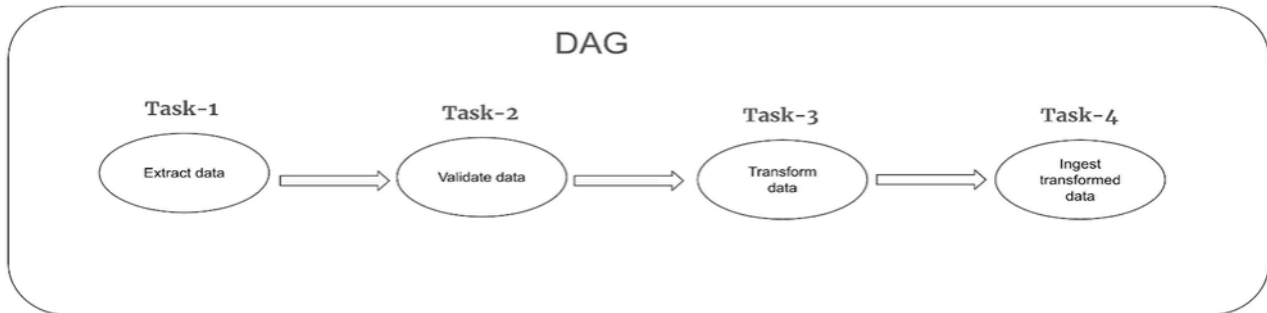

Airflow on AWS - Managed workflow for Apache Airflow (MWAA)

Overview

- An open-source tool for orchestrating complex computational workflows and data processing pipelines.
- On AWS, airflow is a fully managed service that makes it easier to set up and operate end-to-end data pipelines in the cloud at scale.
- Automatically scales resources to meet the demands of your workflows.

Airflow Hooks → Hooks are interfaces to external platforms and databases, providing a reusable way to interact with external systems and databases through established connections.

Airflow Operators → Building blocks of Airflow DAGs. Each operator represents a single task in a workflow, executing a specific function defined by the type of operator used (e.g., PythonOperator, GlueOperator, BashOperator etc).

Airflow Xcoms → XComs allow tasks to exchange messages or data, enabling sharing of small amounts of data between tasks within the same DAG
